

HACCP plans for on-farm storage***Loading into store***

Task 21: Maintaining stored grain in good condition		
Hazard: Grain quality may be lost because the moisture content of the grain is above the safe limit	Preventive measure: Moisture content of the grain must be measured and the grain dried if it is above the limit	Critical control point (CCP): Loading commodity into store
Critical limit: Must not exceed safe moisture content limit for that commodity	Monitoring: Moisture meter must be properly calibrated and be used on all grain parcels	Corrective action: The grain may be aerated if the temperature and moisture content are above safe limits
Verification/records: Calibration of the instruments should be logged	Where to look: <ul style="list-style-type: none"> • safe moisture limits <input type="checkbox"/> • safe moisture level in oilseeds <input type="checkbox"/> • moisture meters types <input type="checkbox"/>.
